"One-Click" and "Zero-Programming" to setup the adapter from a Browser

Supports popular GSM devices

Alarm Protocol Independent

Small one-off setup fee

## Installer Features

The Linksys adapter allows you to send alarm signals in any format, over the Internet from any control panel with a built-in modem or standalone digicom.

Upgrading an existing system to IP is simply a case of connecting the telephone port on the panel to the telephone port on the Linksys adapter and then connecting a LAN cable to a spare port on the Customer router.

Regain the ability to remotely program panels over the Internet if your Customer ceases landline service. The solution does not require a VoIP account, but will work happily alongside one. Supports speech dialers with VoIP account.

Line supervision is accomplished by the Linksys adapter sending regular heartbeats to the server at a programmable interval from 10 seconds upwards. An operator will be alerted in the event of line cut.
